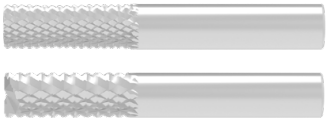
## Tipps



1

▲ Zur Erzeugung sehr scharfer Schneidkanten, um bei GFK und CFK einer Delaminierung des Bauteils vorzubeugen.

2

▲ Zur Erzielung hoher Standzeiten bei der Bearbeitung von AFK, CFK und Graphit.

3

4

▲ Speziell zur Bearbeitung von Honigwabenmaterialien; Einfräsen von Taschen, die nicht durch das ganze Material gehen.

5

▲ Speziell zur Bearbeitung von Honigwabenmaterialien.

▲ Ausfräsen von Aussparungen, die durch das Material gehen, wobei die ziehende Schneide das untere und die drückende Schneide das obere Deckmaterial zerspant und stabilisiert.

6

▲ Zur Bearbeitung von nicht faserverstärkten Kunststoffen und NE-Metallen mit niedrigem Si-Gehalt. (PE, PA, PVC, Acrylglas)

7

8

▲ Zur Bearbeitung von faserverstärkten Kunststoffen und NE-Metallen mit hohem Si-Gehalt.

# Trochoidfräsen

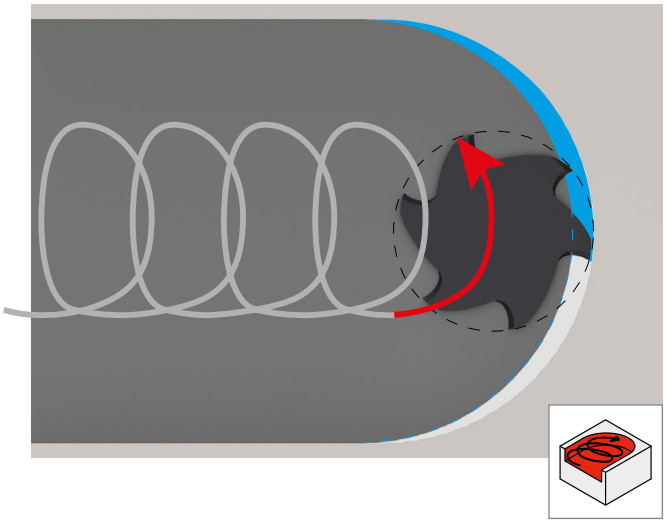
Aufgrund des Trochoidfräsverfahrens sind auch große Zustelltiefen bei labilen und schwachen Maschinen möglich.

Je nach Festigkeit des Werkstoffes beträgt die radiale Zustellung 5–20 % vom Schneidendurchmesser. Da es sich beim Trochoidfräsverfahren um Umfangsfräsen handelt, sind die auftretenden Kräfte geringer.

Beim trochoidalen Fräsen einer Nut sollte der Fräserdurchmesser maximal 70 % der Nutbreite betragen.
Beispiel: Nut 20 mm x 70 % = 14 mm
Ein Fräser mit Ø 14 mm wäre das perfekte Werkzeug.

## Vorteile/Nutzen

- geringerer Werkzeugverschleiß
- Verkürzung der Bearbeitungszeit
- Ausnutzung der vollen Werkzeugschneide
- Reduzierung der Schnittkräfte



## Die meisten CAM Anbieter bieten eine Applikation für das Trochoidfräsen an. Unsere Empfehlungen für diese Anwendung lauten wie folgt:

# Technische Hinweise

## Vorschubgeschwindigkeitsanpassung

Wenn die in den Tabellen angegebene Drehzahl von der eingesetzten Maschinenspindel nicht erzielt werden kann, ist die Vorschubgeschwindigkeit prozentual zur Drehzahl zu reduzieren.

**Beispiel:**
gefordert laut Tabelle = n 50.000 1/min. und $v_f$ 1.000 mm/min.,
vorhandene Maschinendrehzahl = 40.000 1/min.

Berechnung der einzugebenden Vorschubgeschwindigkeit:
40.000 1/min / 50.000 1/min *100= entsprechen 80%
1000 mm/min * 80% = 800 mm/min

Die einzugebende Vorschubgeschwindigkeit = **800 mm/min.**

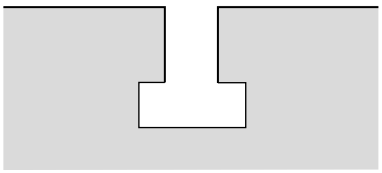
## Schräges Eintauchen mit VHM-Fräsern

Das schräge Eintauchen mit VHM-Schaftfräsern ist je nach Ausführung unter einem Winkel von 2° bis 10° möglich. Eine Kantenschutzfase bzw. ein Eckenradius sind von Vorteil.

Empfohlene Eintauchwinkel für VHM-Fräser:

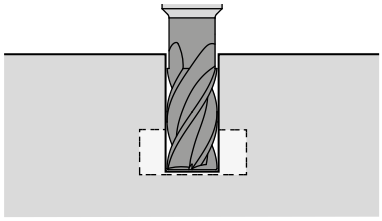
- Eintauchwinkel bis ≤ 3-Schneider → 6°–10°
- Eintauchwinkel für 4-Schneider → 3°–6°
- Eintauchwinkel für 5-Schneider → 2°–3°
- Eintauchwinkel für > 5-Schneider → nur bedingt möglich

## Vorbereitung für T-Nutenfräser



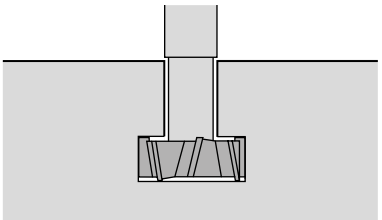
Um mit dem VHM-T-Nutenfräser eine T-Nut herzustellen, gehen Sie wie folgt vor:

1



Fräsen Sie die Nut bis etwa 0,5 mm über den Boden vor.
Boden entspricht dem Fertigmaß der T-Nut.
Die Nutbreite sollte in diesem Arbeitsschritt auf Fertigmaß gearbeitet werden.

2



Anschließend fräsen Sie mit dem T-Nutenfräser die Nut fertig.
Beim Eintritt ins Material ist der Vorschub um 50 % zu reduzieren

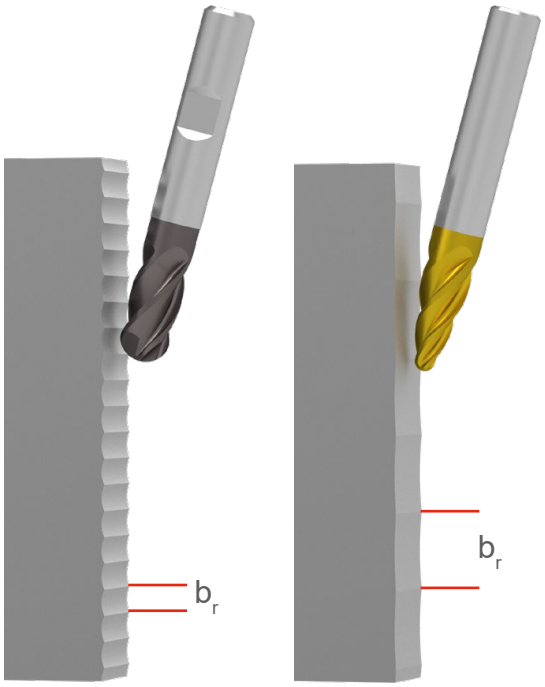
# Gegenüberstellung – Radiusfräser vs. 3D Finish

## 3D Finish

- Radius unabhängig von Werkzeugdurchmesser
- hohe Zustellungen möglich bedingt durch den hohen Radius
- Werkzeuge mit großem Radius und kleinem Schaftdurchmesser sind günstiger, da Hartmetallanteil geringer, z.B. Durchmesser 16 mm, Radius 1500 mm

## Radiusfräser

- Radius abhängig vom Werkzeugdurchmesser
- nur geringe Zustellungen möglich, Bindung durch den kleinen Radius
- Werkzeuge mit großem Durchmesser / Radius sind aufgrund des hohen Hartmetallanteils teuer, z.B. Durchmesser 16 mm Radius 8 mm



### Formeln zur Berechnung:

$$b_r = 2 \times \sqrt{R_{th} \times (r \times 2 - R_{th})}$$

$$R_{th} = r - \sqrt{\frac{(r \times 2)^2 - b_r^2}{4}}$$

$$R_a \simeq 0{,}1 \times R_{th}$$

$$R_{th} \simeq R_a / 0{,}1$$

# Ergebnis

Geforderte Oberflächengüte = $R_a$ 0,4
$R_{th} \simeq 0{,}4 / 0{,}1 \simeq 4\ \mu m = 0{,}004$ mm

Radiusfräser
Durchmesser 16 mm, Radius 8 mm
$b_r = 2 \times \sqrt{0{,}004 \times (8 \times 2 - 0{,}004)}$
**$b_r$ = 0,51 mm**

**3D Finish**
Durchmesser 16 mm, Radius 1500 mm
$b_r = 2 \times \sqrt{0{,}004 \times (1500 \times 2 - 0{,}004)}$
**$b_r$ = 6,93 mm**

# Berechnungshilfen für das Kopierfräsen

## Theoretische Rauhtiefe ($R_{th}$) und Zeilensprung ($b_r$)

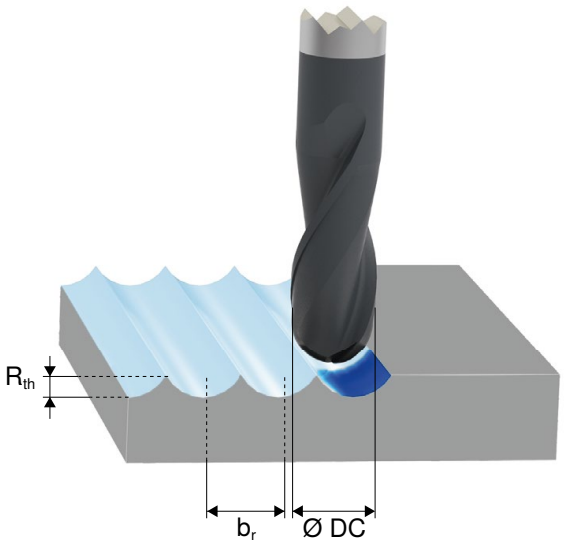
$$R_{th} = r - \sqrt{\frac{(r \times 2)^2 - b_r^2}{4}}$$

$$b_r = 2 \times \sqrt{R_{th} \times (r \times 2 - R_{th})}$$

$$R_{th} \simeq R_a / 0{,}1$$

$$R_a \simeq 0{,}1 \times R_{th}$$

Um beim Kopierfräsen eine möglichst saubere Oberfläche zu erreichen, ist der Zeilensprung $b_r$ dem Fräserdurchmesser DC anzupassen. Je kleiner der Fräserdurchmesser DC ist, desto kleiner muss der Zeilensprung $b_r$ gewählt werden.



## Drehzahlkorrekturfaktoren (Kf n) für das Kopierfräsen

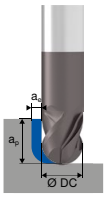
# Berechnungshilfen für das Kopierfräsen

Beim Umfangsfräsen bzw. Kugelkopffräsen bei Schnitttiefen von $\mathbf{a_p} \geq 0{,}5 \times DC$ und $\mathbf{a_e} = 0{,}2$ bis $0{,}5 \times DC$ ist die Drehzahl anhand folgender Formel zu ermitteln:

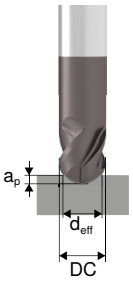
$$n = \frac{v_C \times 1000}{DC \times \pi}$$



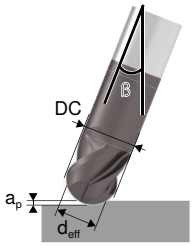
Beim Kugelkopffräsen muss der effektive Fräserdurchmesser $\mathbf{d_{eff.}}$ anhand folgender Formel ermittelt werden:

**Radius- und Kugelkopffräser**

$$d_{eff.} = 2 \times \sqrt{a_p \times (DC - a_p)}$$

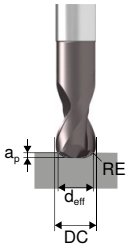


$$d_{eff.} = DC \times \sin\left(\beta \pm \arccos\left(\frac{DC - 2a_p}{DC}\right)\right)$$



**Torusfräser**

$$d_{eff.} = (DC - 2RE) + 2 \times \sqrt{a_p \times (2RE - a_p)}$$

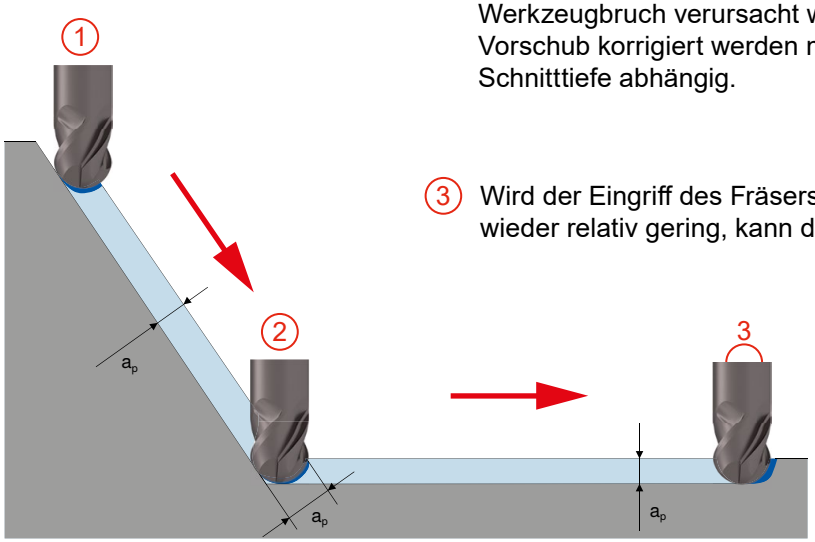


# Hinweise zum Tauch- und Ziehfräsen

① Beim Bearbeiten der Nutflanken sind relativ hohe Vorschübe möglich, da der Fräser nur einen verhältnismäßig geringen Eingriff ins Material hat (blau gekennzeichneter Bereich).

② Starke Erhöhung der Schnitttiefe beim Erreichen des Nutgrundes durch größere Eingriffsbreite des Fräsers. Hier ist unbedingt der Vorschub zu reduzieren, da sonst durch Vibrationen, Abdrängung oder Rattern ein Werkzeugbruch verursacht werden kann. In welcher Größenordnung der Vorschub korrigiert werden muss, ist vom Kopierwinkel und der axialen Schnitttiefe abhängig.

③ Wird der Eingriff des Fräsers beim Bearbeiten des Nutgrundes wieder relativ gering, kann der Vorschub wieder erhöht werden.



**Richtlinie:**
Je steiler der Winkel, desto kleiner der Vorschub. Je stumpfer ein Winkel, desto größer der Vorschub.

Beim Tauch- bzw. Ziehfräsen von Gesenken ist der Vorschub den verschiedenen Fräspositionen anzupassen. Andernfalls kann die Schneide durch Überlastung (Vibrationen, Abdrängung oder Rattern) beschädigt werden.
